

WIN/WIN Reactor Electricity Analysis

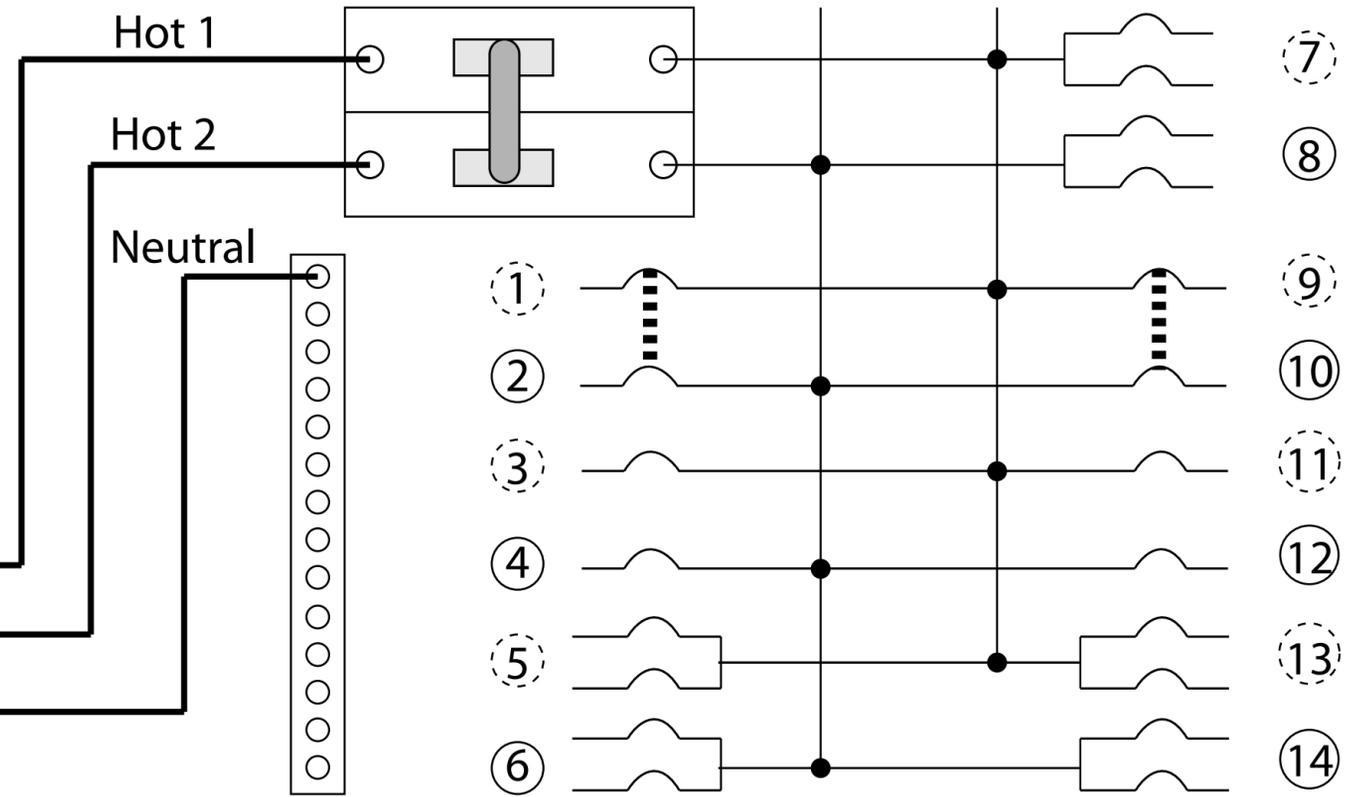

From Electrical Service
Transformer (grid) -> **definitely alive!**

L1 | N | L2

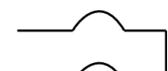

! DANGER!
Here you should find 220 V between those terminals.
Be super careful..

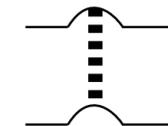

As long as this connection is not made by a meter or illegal action, you will not have electricity.

Connection to Electrical Service

 1 inch circuit breaker (all yours are 1 inch)

 2 x 1/4 inch or 1 inch circuit breakers allowed (old)

 Double pole 220V breaker possible, but you have none there

IMPORTANT CONCLUSION:

As long as you do not either bypass (very dangerous) or install a meter, you will not be able to get your house 'alive' again. As right now, there is no physical connection between the grid and your house. The meter does that normally for you. It connects load (house) with line (grid).
